

# SOIL TEST REPORT

AGRICULTURAL & ENVIRONMENTAL TESTING LABORATORY  
AND UVM EXTENSION

UNIVERSITY OF VERMONT

SAMPLE DESCRIPTION  
planting: mixed vegetables HOME GROUNDS  
established ? years  
soil texture: loamy  
soil drainage: fair  
size of area: < 1 acre

LAB NUMBER DATE  
L110981 08/15/2011

REPORT FOR: 863-0420  
Dan Cahill / Burlington Park  
645 Pine St, Ste B  
Burlington, VT 05401

COUNTY CHITTENDEN 9  
FIELD NAME Star Farm GQ

## SOIL TEST RESULTS

	LOW	MEDIUM	OPTIMUM	EXCESSIVE
Avail. phosphate (ppm P) 48.7	*****			
Potash (ppm K) 132	*****			
Magnesium (ppm Mg) 209	*****			
pH 6.9				
Calcium (ppm Ca) 1562				

Please refer to the back side for a more detailed description of the test

Based on your soil test, we recommend:

pH  
Your pH is in the optimum range. No lime will be needed this year.

Nitrogen, Phosphorus, and Potassium

Commercially sold fertilizer, manure, and composts are labeled by their nitrogen (N), phosphorus (P2O5), and potassium (K2O) content, in that order. For example, a bag of 5-10-10 is 5% N, 10% P2O5, and 10% K2O.

Your soil tested EXCESSIVE in phosphorus and OPTIMUM in potassium.  
Add small amounts (2-3 lbs per 100 sq ft) of a high nitrogen fertilizer such as 6-2-1, 7-3-4, or whatever your local supplier recommends.

Magnesium and Calcium

You do not need to add magnesium at this time.  
Your calcium level is sufficient.

Use your experience and observations. Soil tests are only one tool to aid your gardening decisions.

If you are adding large amounts of home-made manure or compost, less fertilizer will be needed

Splitting your nitrogen application will often increase growth in long-season crops.  
Sidedress (dribble alongside the plants) N about one month after emergence or transplanting.

Phosphorus fertilization is important in the early season, when soils are cold. Incorporating some of the P fertilizer directly into the plant row will be helpful.

Potassium can be added by incorporating wood ashes. But be careful, wood ashes raise your pH. Do not add if lime is not recommended. Add no more than 1/2 the amount recommended for lime.

=> If you have questions about your soil test, please read both sides of this report carefully  
If you still have questions, call the UVM Extension Master Gardening Helpline;

# UVM AGRICULTURAL TESTING LAB ANALYSIS RESULTS

L 110981 08/15/2011

LAB # Date Completed

## PACKAGE 1 MICRONUTRIENTS \* (ppm in soil)

		Your results	Avg. levels in Vermont soils
Sodium	(Na)	15.0	20.0
Iron	(Fe)	2.9	7.0
Boron	( B)	0.4	0.3
Manganese	(Mn)	3.8	14.0
Copper	(Cu)	0.2	0.4
Zinc	(Zn)	5.2	1.0
Sulfur	( S)	10.0	

\* Micronutrients are not usually deficient in Vermont soils. The average levels are provided for comparison only and are not necessarily optimum levels for plant growth. Additions of micronutrient fertilizers should be done with caution because of the narrow range between deficiency and toxicity. Organic residues such as manure, are usually good sources of micronutrients.

## PACKAGE 2 METALS \*\* (ppm in soil)

		Your results	Normal levels	High levels
Copper	(Cu)	0.2	0.5	more than 10
Cadmium	(Cd)	<.2	0.2	more than 2
Chromium	(Cr)	<.5	1.0	more than 20
Zinc	(Zn)	5.2	10	more than 80
Nickel	(Ni)	<.5	1.0	more than 20
Lead	(Pb)	<.5	1.0	more than 50

\*\* Normal levels are given for comparisons. Results higher than normal but lower than the "high level" are not considered dangerous for growing vegetables.

% Organic Matter 3.6

%Ca	%K	%Mg
79.0	3.4	17.6
